

POLYMER PROCESSING SEMINAR

DISCOVER HOW WE CAN HELP YOU IMPROVE
YOUR PRODUCTION PROCESS

11 JANUARY 2018 FROM 10 A.M. TO 1:30 P.M.

Control the process to control the Product

Introduction to
Twin screw **process simulation**
how does it work ...

Control the process to control the Product

SC-Consultants : industrial processes simulation

- ▶ 3 main activities
 - ▶ Software development
 - ▶ Consulting
 - ▶ Strategic Initiatives (R&D)
- ▶ Strong R&D partnership
 - ▶ Bonn University
 - ▶ CEMEF
 - ▶ Fraunhofer ICT

SC-Consultants background

- ▶ Mechanics impact on the process

Extrusion

Extrusion range

1D/2D quick calculation software for twin-screw and single-screw extrusion processes

Mixing

Mixing range

3D software especially applied to your own industrial cases about extrusion and mixing processes

Ludovic[®] software

- ▶ Corotating twin screw extruder simulation
 - ▶ Generic application
 - ▶ All packaged
 - ▶ Process-driven results
 - ▶ Fast overview

What is modeling ?

- ▶ Reproducing a physical phenomena by a model

What is simulation ?

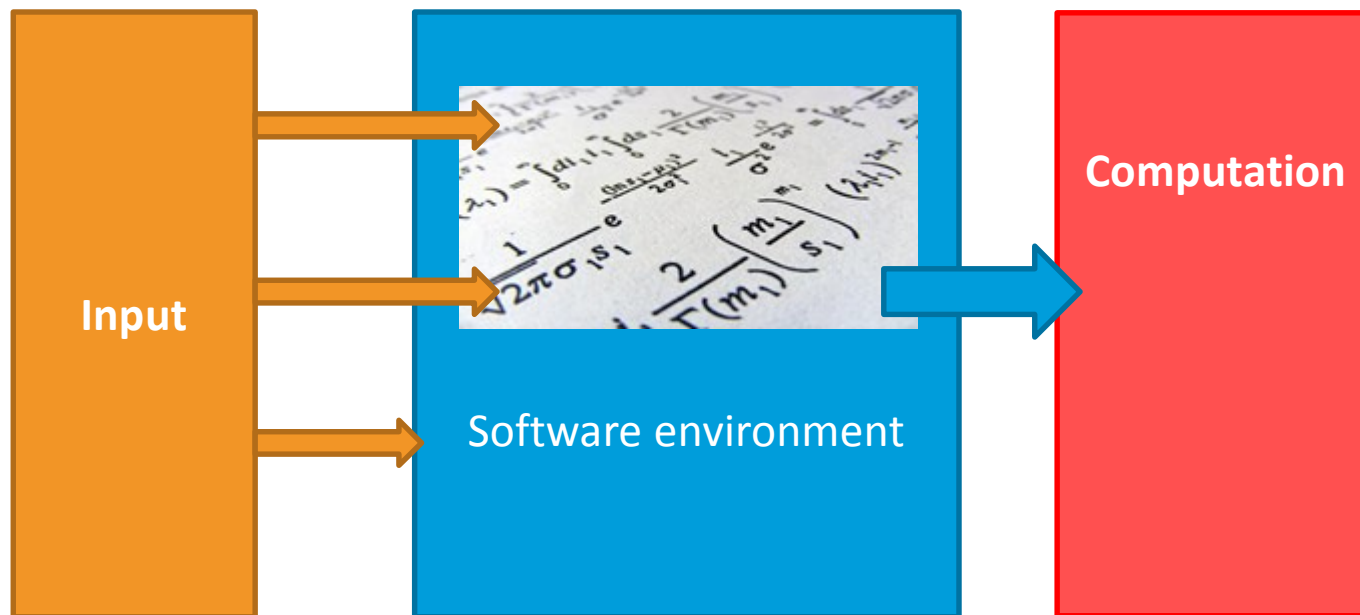

- ▶ Reproducing a physical phenomena by a model

Software environment

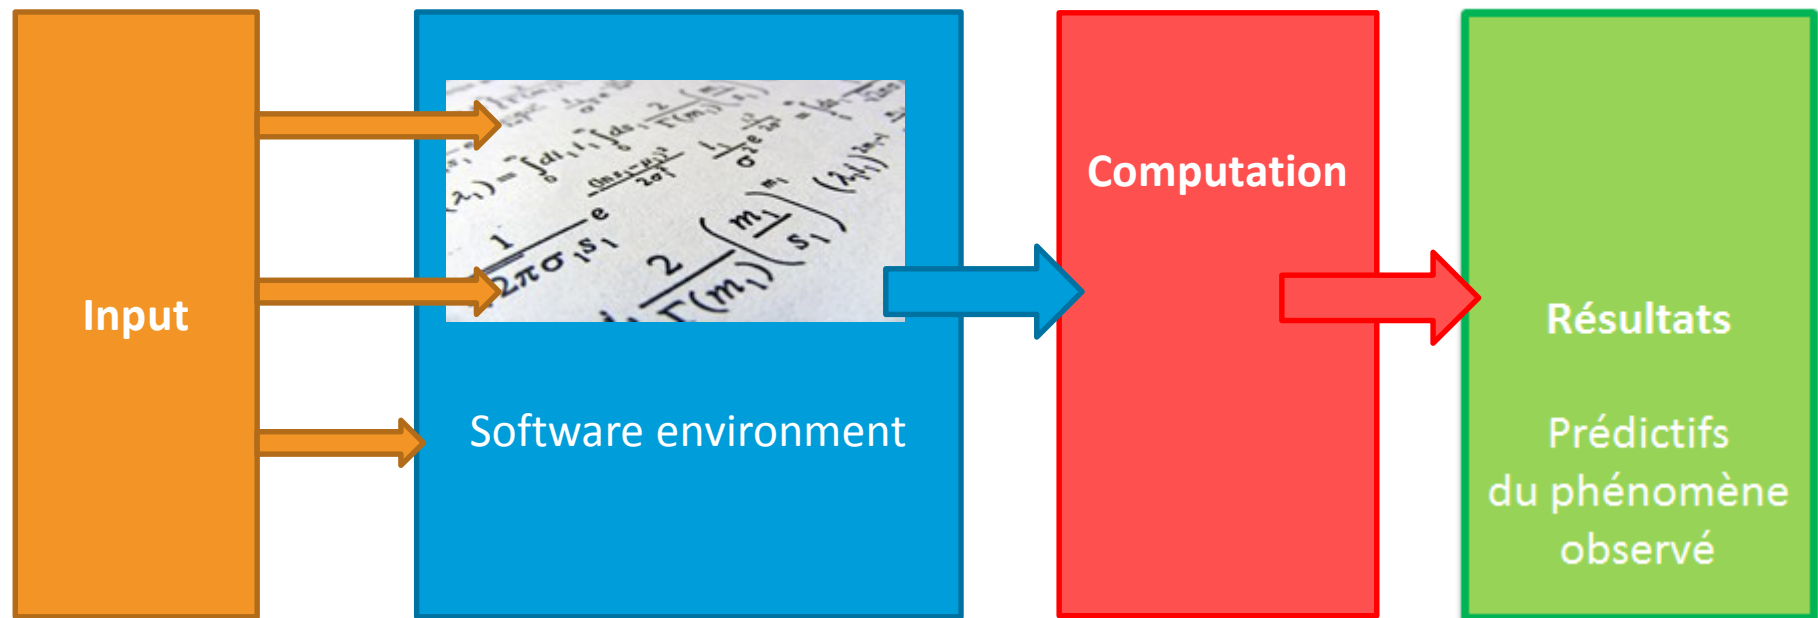

What is simulation ?

- ▶ Reproducing a physical phenomena by a model

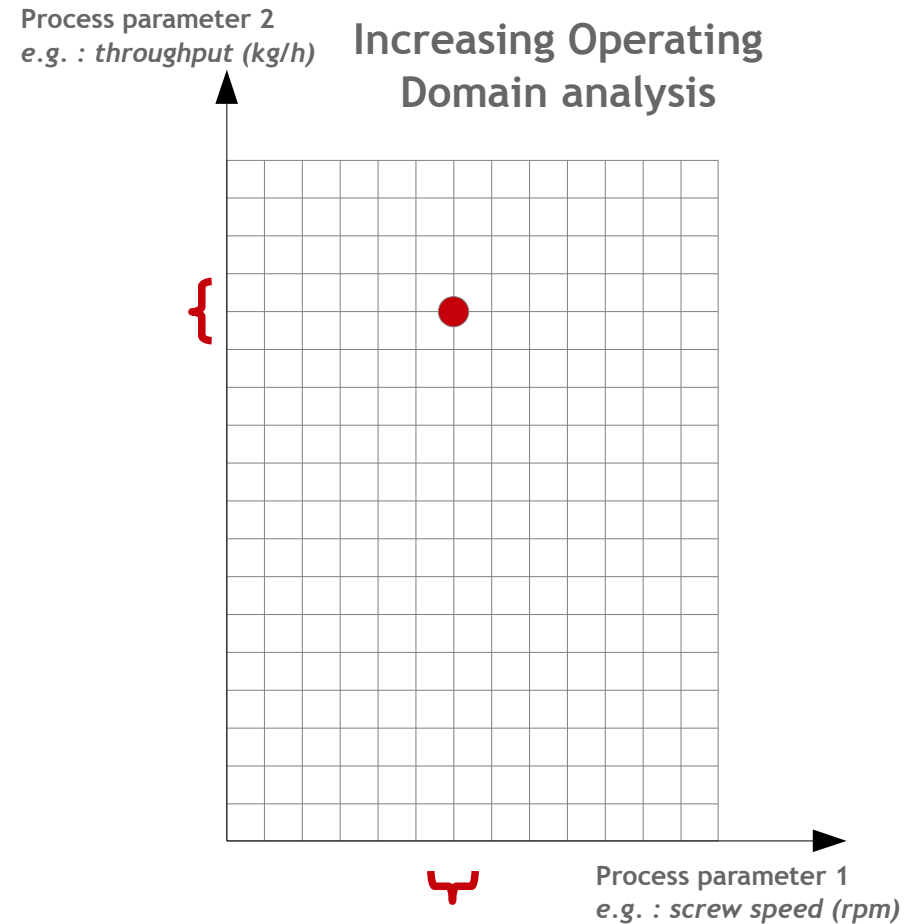

What is simulation ?

- ▶ Reproducing a physical phenomena by a model

The interest of modeling - different focuses

- ▶ 1 Simulation
 - ▶ **For checking**
 - ▶ 1 set of operating conditions

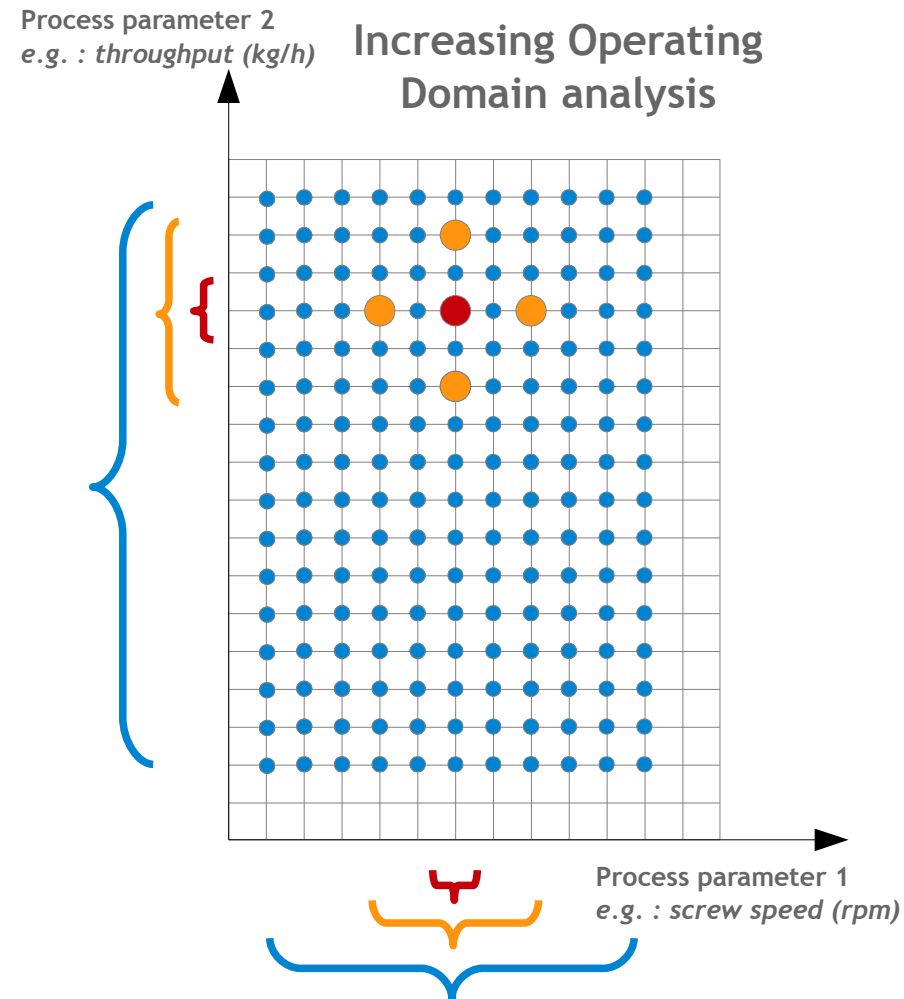

The interest of modeling - different focuses

- ▶ 1 Simulation
 - ▶ **For checking**
 - ▶ 1 set of operating conditions
- ▶ Comparison of simulations
 - ▶ **For optimizing**
 - ▶ Few sets of data

The interest of modeling - different focuses

- ▶ 1 Simulation
 - ▶ **For checking**
 - ▶ 1 set of operating conditions
- ▶ Comparison of simulations
 - ▶ **For optimizing**
 - ▶ Few sets of data
- ▶ 1 DoE / QbD
 - ▶ **For anticipating**
 - ▶ Hundred of Simulations
 - ▶ Covering a functioning domain
 - ▶ Example : new formulation

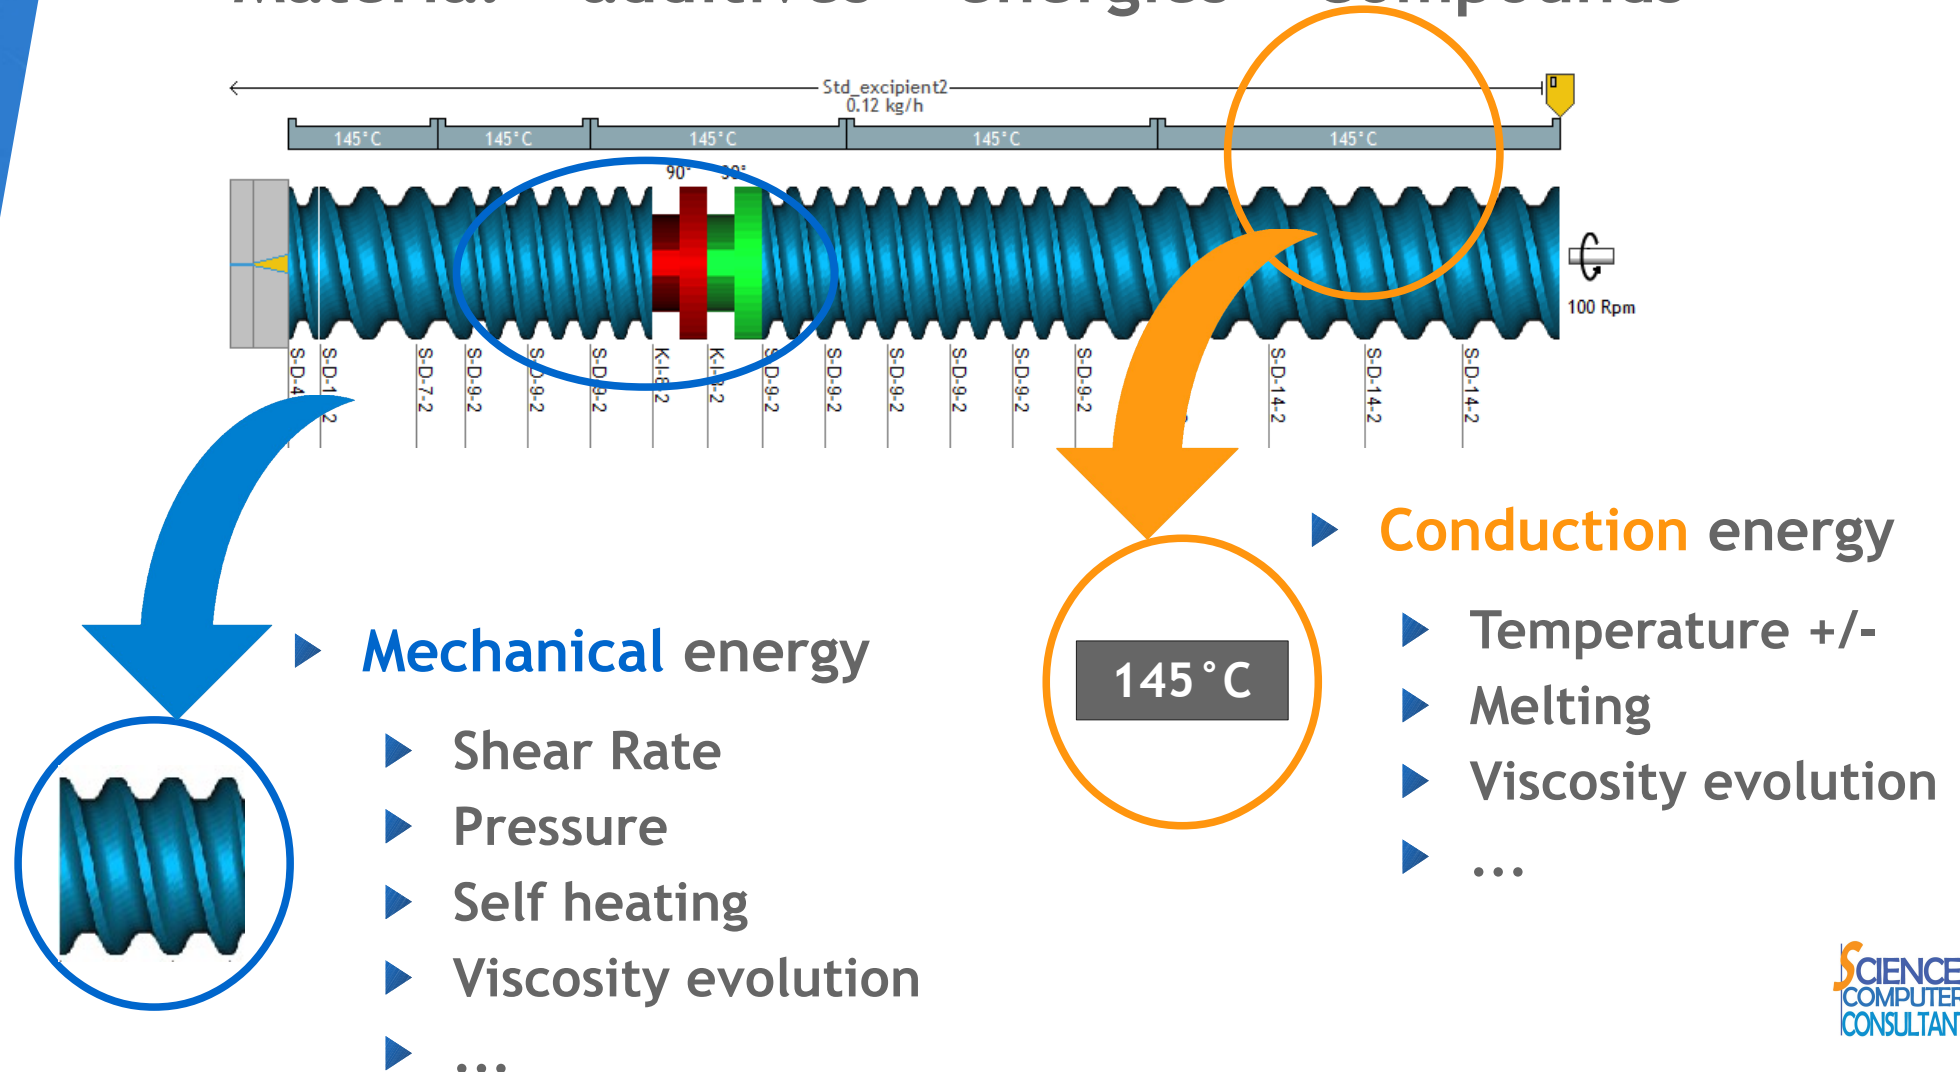

Twin Screw simulation

Control the process to control the Product

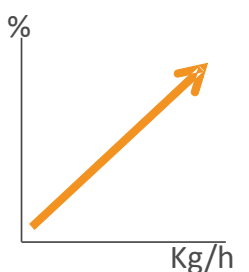

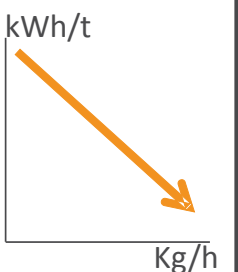

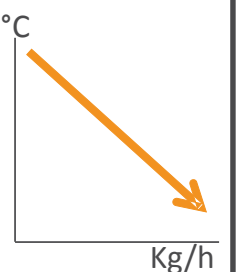

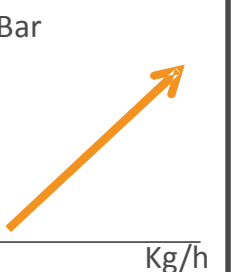

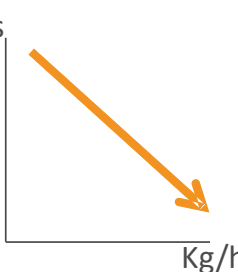

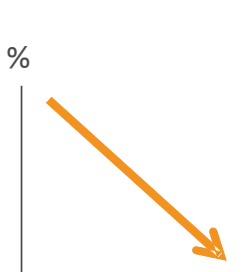

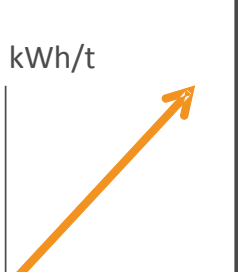

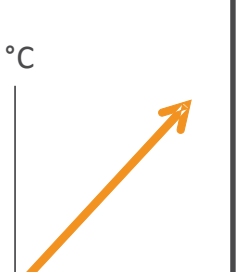

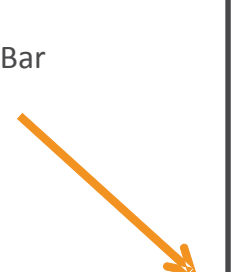

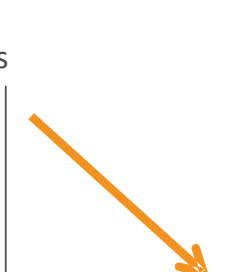

The polymer process in TSE

- ▶ Material + additives + energies = Compounds

TSE - playing with process parameters

- ▶ With Ludovic[®] : going further than rules of thumb

	Torque (%)	SME (kWh/t)	T°C	P (bar)	Residence Time(s)
Throughput (kg/h)					
Screw Speed (rpm)					

Example of common process parameters impact

Why TSE Simulation

- ▶ Controlling the thermo-mechanical history from the material to the product
 - ▶ Getting the material sensitivity
 - ▶ Getting the process trends
 - ▶ Cutting down the trials

Controlling the process

▶ Hands on the energy balance

- ▶ Checking the machine capabilities
- ▶ Checking the mixing efficiency of the process

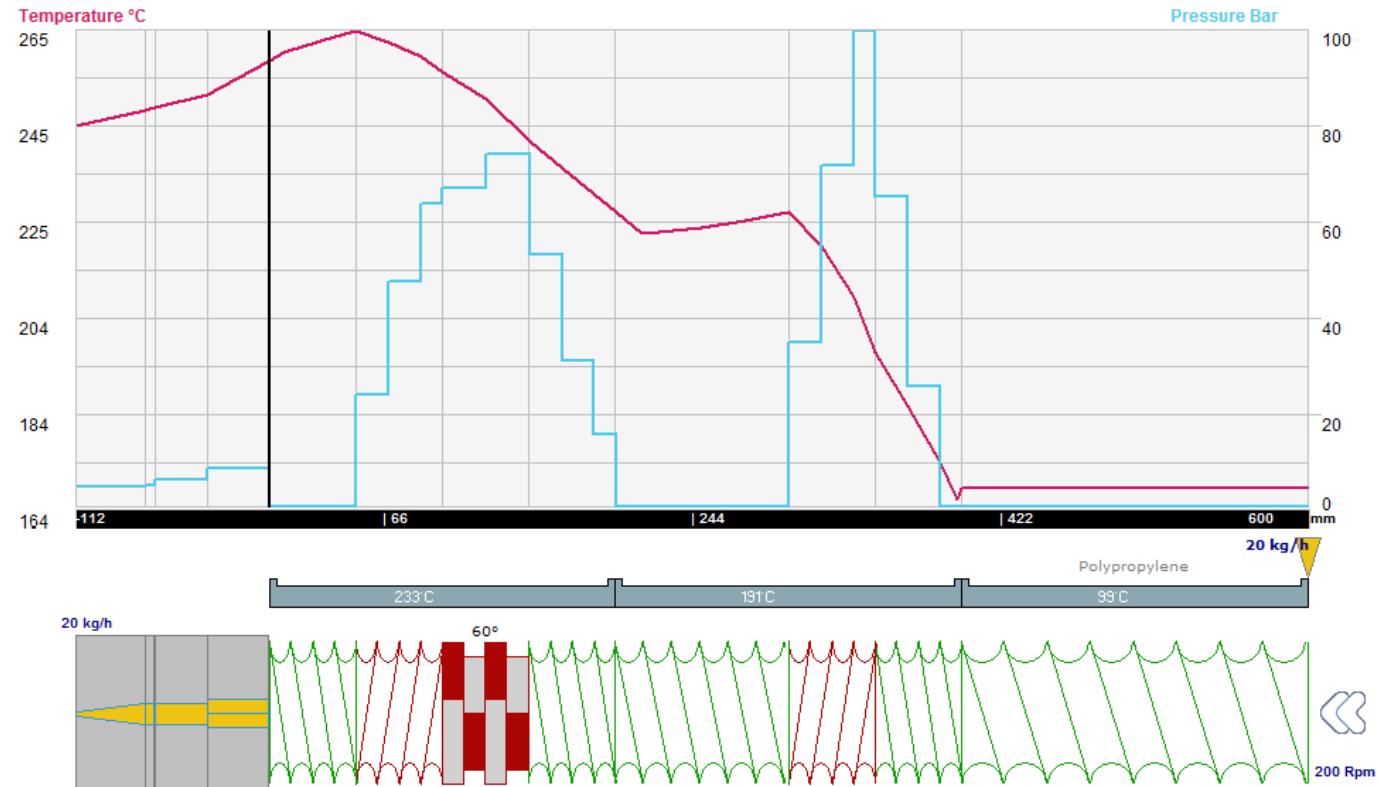

Mean residence time.....	= 37.8 s
Dissipated Energy (viscous dissipation - screw)....	= 118 kWh/t
Specific energy (solid transport - screw).....	= 10 kWh/t
Melting Energy (screw).....	= 3 kWh/t
Dissipated Energy (viscous dissipation - die).....	= 0 kWh/t
Total Conduction Energy (Screw+Die).....	= -77 kWh/t
Total product Energy.....	= 54 kWh/t
Total extruder Energy (abs. value of conduction).	= 208 kWh/t
Power engine.....	= 3 kW
Torque / Shaft.....	= 63 N.m
SME.....	= 131 kWh/t

Distribution of energy

Controlling the Product

- ▶ Thermo-mechanical evolution
 - ▶ Displayed along the screw profile
 - ▶ Describes the material history

4

Leistritz Experiments

Control the process to control the Product

Experiments vs Simulations

▶ Background

- ▶ During a workshop at Axel'one platform (1)
- ▶ Goal : showing the reliability of the Ludovic® results

▶ The Configuration

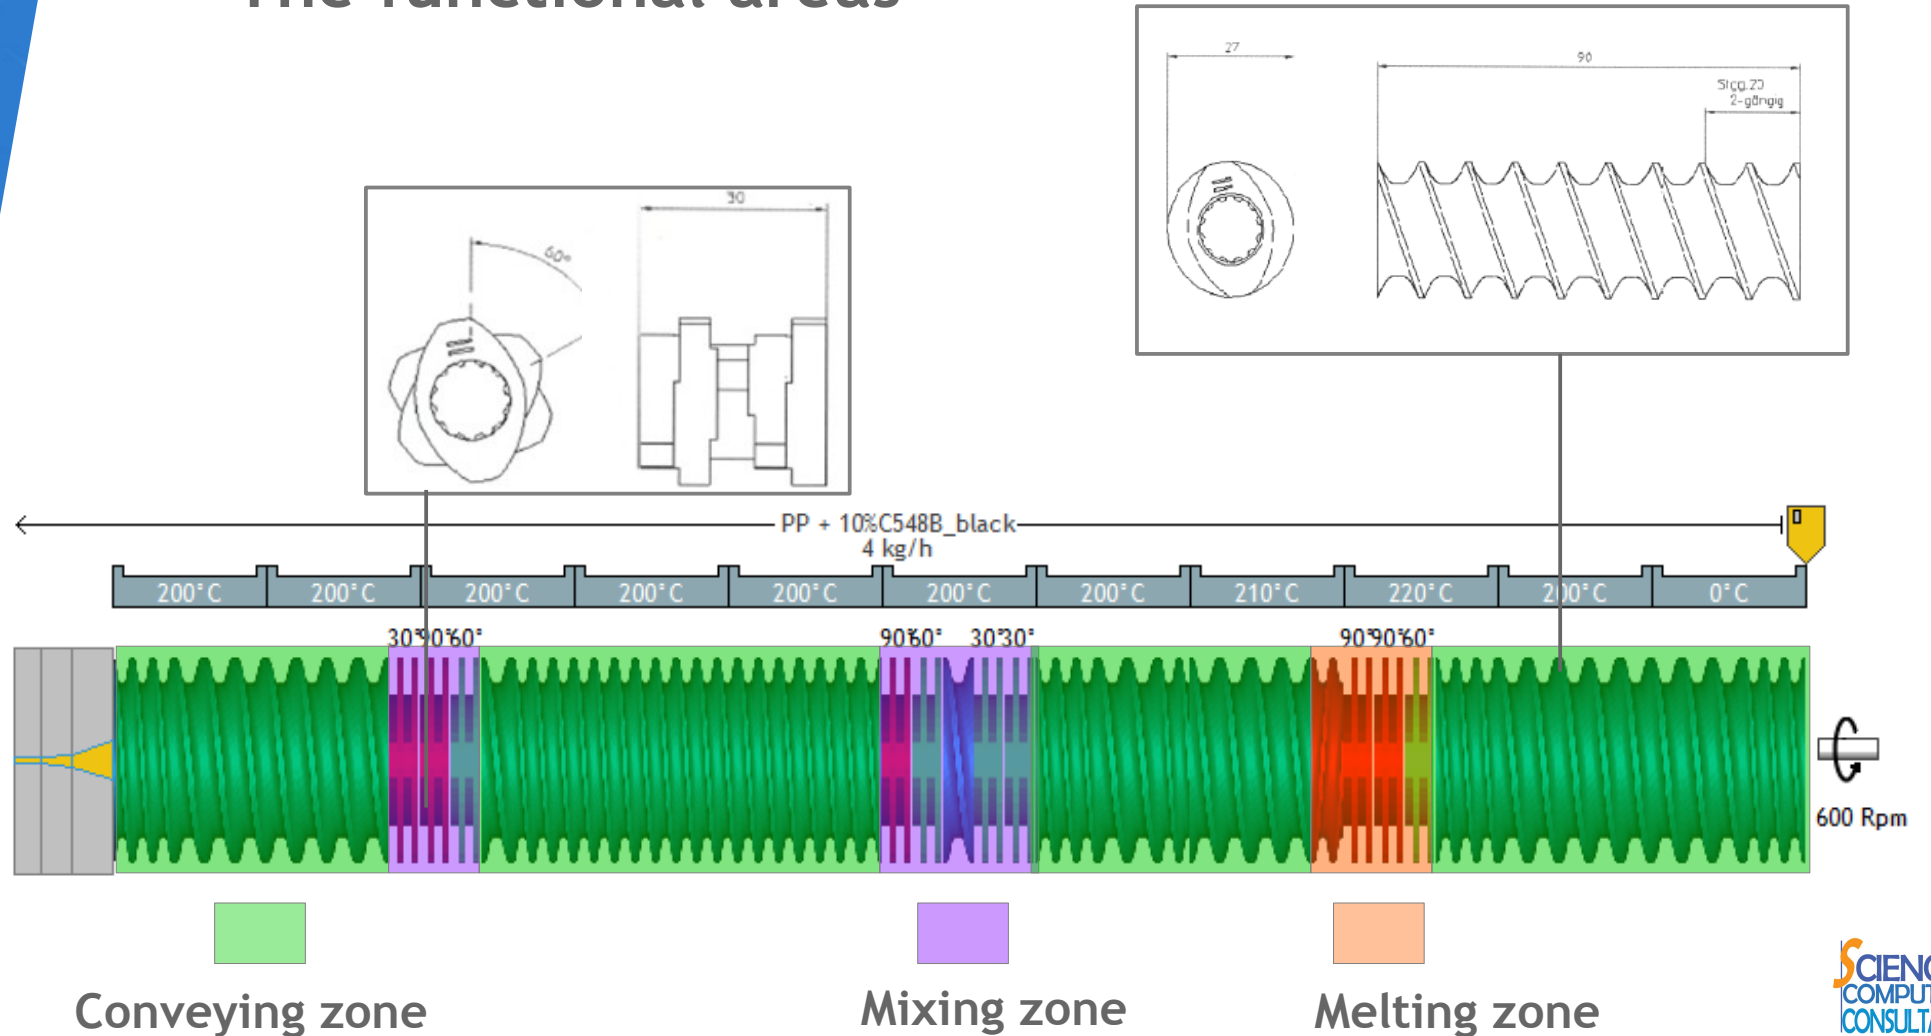

- ▶ Leistritz ZSE 18 MAXX 44D
- ▶ PP (H7020) + CaCo3

(1) <https://www.axel-one.com/ppi-plateforme-procedes-innovants>

The ZSE 18 - the screw profile

► The functional areas

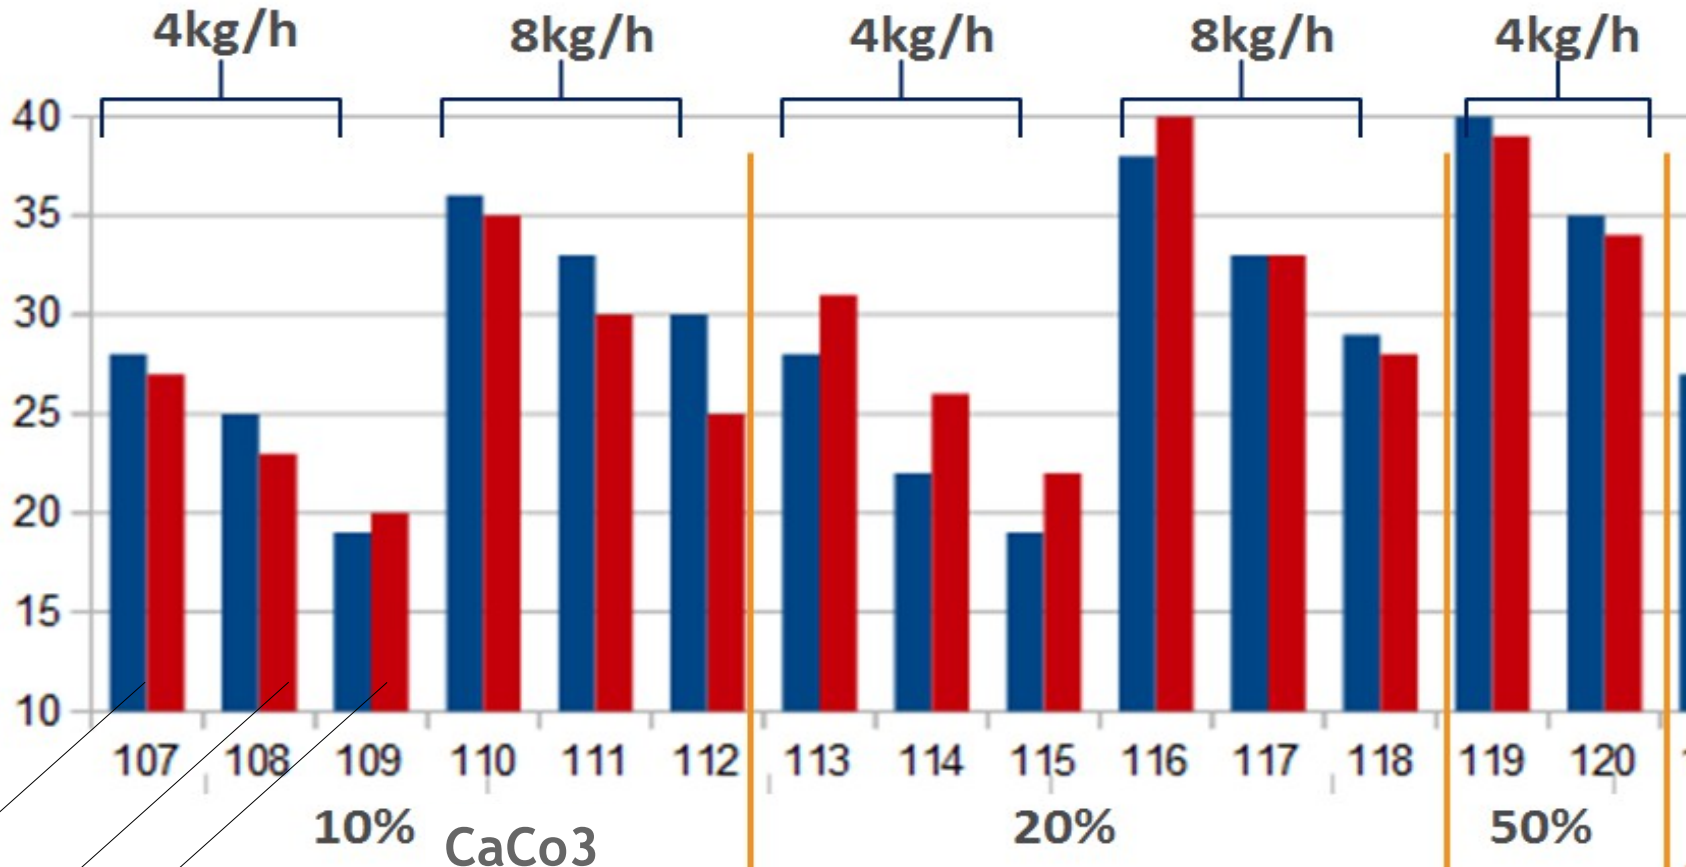

Torque Comparison

300rpm 600rpm 900rpm

Pressure

Measurements performed at the screw head

Pressure (Bar)

300rpm 600rpm 900rpm

Temperature Comparison

Measurements performed at the die exit with a sensor

Temperature (°C)

300rpm 600rpm 900rpm

Performing a scale up *From ZSE18 to ZSE35iMAXX machine*

Control the process to control the Product

The targets

- ▶ From a ZSE 18 mm
- ▶ To a ZSE 35iMAXX

Example of a ZSE 35iMAXX

Scale up

Methodology

▶ 1.

Lab scale preparation

▶ 2.

Industrial scale definition
Screw design
Best Trends

▶ 3.

Industrial scale OPTIMIZATION

1. Scale up - from the lab scale

Step by step

- ▶ 1. Define the best configuration in **ZSE18** between :
 - ▶ 2 materials
 - ▶ PP + 10% CaCo₃
 - ▶ PP + 50% CaCo₃
 - ▶ Rotation speed [300;600;900] RPM
 - ▶ Throughput = 4 kg/h

1. Scale up - from the lab scale

ZSE18 scale : temperature profile at 600 RPM

For 600 RPM : Temperature : 230°C - 280°C
The temperature of product PP + 50% CarCo3 is too high

1. Scale up - from the lab scale

Step by step

▶ 1. Best configuration in ZSE18 :

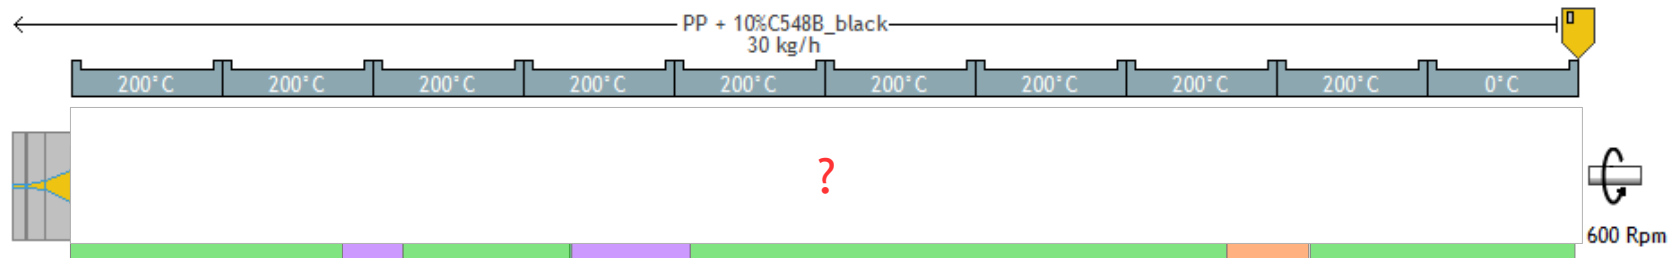

- ▶ Material : PP + 10% CaCo3
- ▶ Identified optimized process parameters at lab scale :
 - ▶ RPM = 600 tr/min
 - ▶ Q = 4 kg/h
 - ▶ $T^{\circ}_{\text{barrel}} = 200^{\circ}\text{C}$

2. Scale up - to the industrial line

Build the ZSE35 configuration

ZSE18 44D

ZSE35 48D

-  Conveying zone
-  Mixing zone
-  Melting zone

2. Scale up - to the industrial line

Build the industrial configuration

2. Scale up - to the industrial line

Define the process parameters (RPM, Q, T°) (estimation)

▶ Constraints on Products characteristics :

- ▶ Temperature : max 260 °C
- ▶ SME ~ 260 kWh/t, > 200 kWh/t
- ▶ Residence time : as close as possible
- ▶ Maximize throughput

▶ Constraints on extruder for ZSE35:

- ▶ Torque max (per shaft) : 694 Nm
- ▶ Motor Power (kW max) : 91,8
- ▶ Screw speed max : 1200 rpm

2. Scale up - to the industrial line

Define the process parameters (RPM, Q, T°) (estimation)

- ▶ 600 RPM
- ▶ Regulation temperature = 200 °C
- ▶ Throughput estimation :

$$Q_{ind} = Q_{lab} \left(\frac{D_{ind}}{D_{lab}} \right)^3$$

$$Q_{ind} = 4 \left(\frac{35}{18} \right)^3 \sim 30 \text{ (kg/h)}$$

2. Scale up - to the industrial line

Lab scale vs industrial scale - Temperature

2. Scale up - to the industrial line

Lab scale vs industrial scale - cumulated strain

- Cumulated strain is a quantitative mixing index for compounding

2. Scale up - to the industrial line

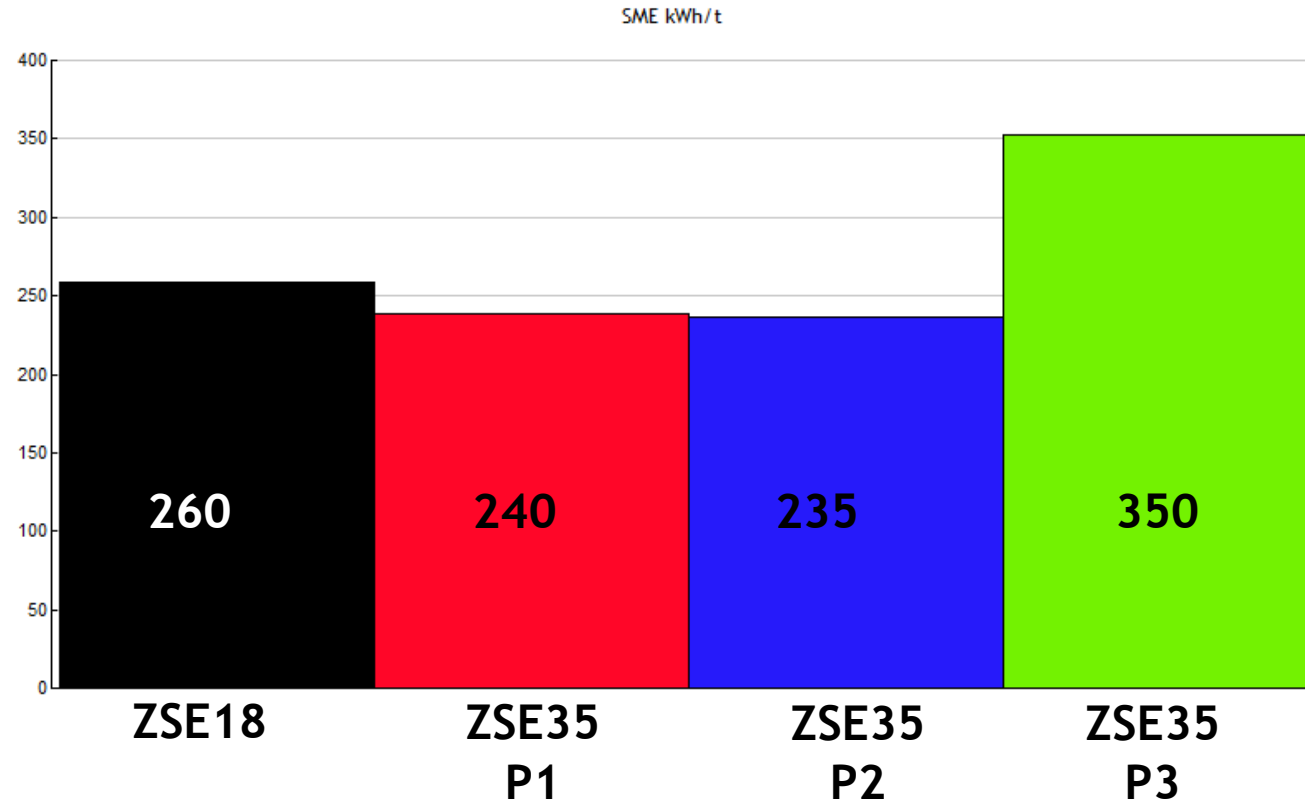

Lab scale vs industrial scale - dissipated energy

- Dissipated energy is a quantitative mixing index for compounding

2. Scale up - to the industrial line

ZSE18 vs industrial scale - SME

- *The SME in industrial scale for **P1** & **P2** is lower than the lab scale but still ok according to criterion*
*The SME for **P3** is larger than lab scale, so criterion respected*

2. Scale up - to the industrial line

ZSE18 vs industrial scale - RTD

- The residence time distribution is quite close from the ZSE18 scale for **P1** & **P2**.
RTD is a little bit longer for **P3**.

3. Scale up - process optimization

Which industrial configuration for optimization ?

	P1	P2	P3
Temperature	✓	✓	~
SME	~	~	✓
RTD	✓	~	~
Cumulated strain	~	~	✓
Dissipated energy	~	~	✓

- Selection of **P3** to optimize process parameters using DoE

3. Scale up - process optimization

Which industrial configuration for optimization ?

- ▶ Regarding the results comparison between ZSE18 and the 3 proposed configurations at scale ZSE35 :
 - ▶ **P1** provides a good SME & RTD close to ZSE18 one. T °C profile is a little bit high but still acceptable. Cumulated strain too low
 - ▶ **P2** provides a good SME. Mean residence time is close to ZSE18 one but the distribution is quite different. T °C profile is a little bit high but still acceptable. Cumulated strain too low
 - ▶ **P3** provides a high SME & RTD a little bit too long comparing to ZSE18 one. T °C profile is a little bit too high but still acceptable. Good cumulated strain
- ▶ Selection of **P3** to optimize process parameters using DoE

3. Scale up - process optimization

ZSE35 optimization

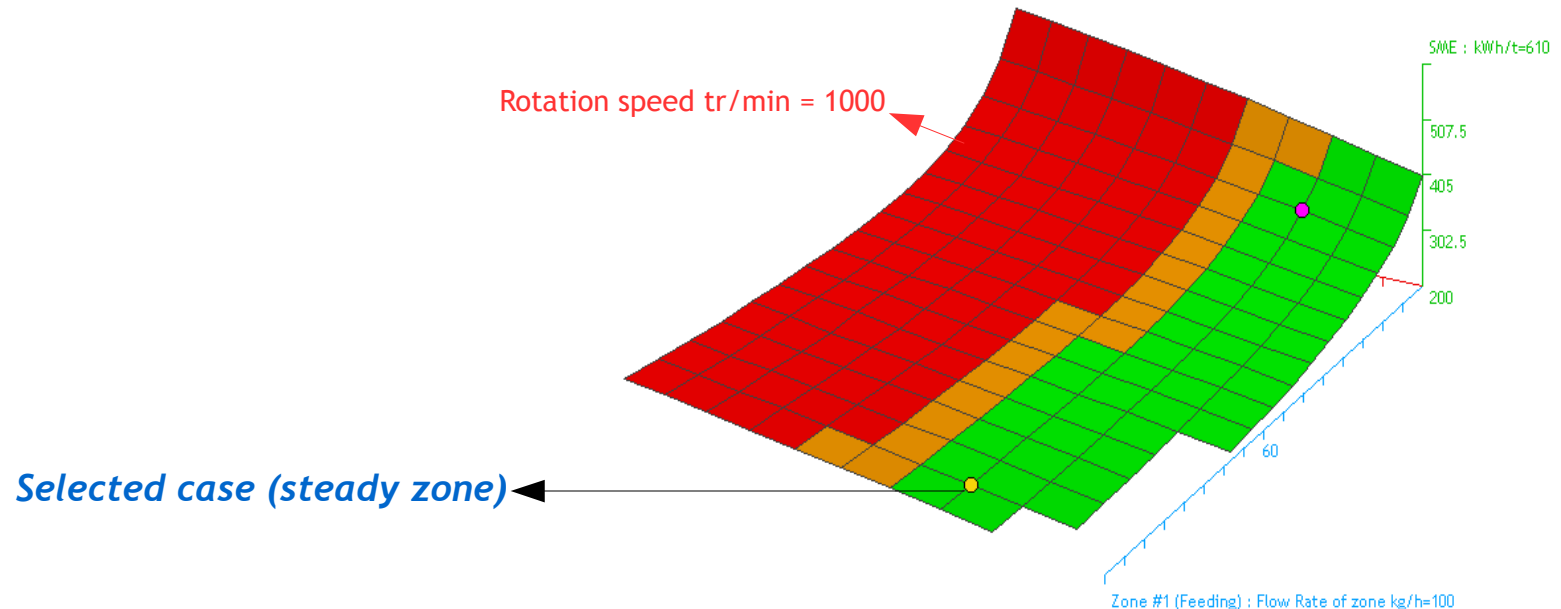

- ▶ DoE settings up
 - ▶ Process parameters
 - ▶ Throughput : [20;100] kg/h / 17 steps
 - ▶ RPM : [500;1000 RPM] / 11 steps

 - ▶ Observed Results
 - ▶ RTD
 - ▶ SME
 - ▶ Dissipated energy
 - ▶ Cumulated strain
 - ▶ Torque
 - ▶ Temperature max

3. Scale up - process optimization

ZSE35 optimization

Active	Result	Criterion	Value (x / y)	Range
<input checked="" type="checkbox"/>	SME : kWh/t	$\geq X$	200	[202.42 , 607.57]
<input type="checkbox"/>	RTD - Mean : s	$\leq X$		[17.45 , 67.35]
<input type="checkbox"/>	RTD - Variance :	$\leq X$		[8.71 , 176.4]
<input checked="" type="checkbox"/>	Temperature (Max) : °C	$\leq X$	260	[245.4 , 308.9]
<input checked="" type="checkbox"/>	Torque / Shaft : N.m	$\leq X$	694	[58.02 , 166.94]
<input type="checkbox"/>	Dissipated Energy (viscous dissipation - screw) : kWh/t	$\leq X$		[118.89 , 524.51]
<input type="checkbox"/>	Cumulated Strain (Pos=-63) :	$\leq X$		[4821.13 , 28068.67]

3. Scale up - process optimization

ZSE35 optimization - comparison with ZSE18

3. Scale up - process optimization

ZSE35 optimization - comparison with ZSE18

Same target in terms of SME

3. Scale up - process optimization

ZSE35 optimization - comparison with ZSE18

**Industrial conditions :
increasing the
throughput**

SME > 200 kWh/t : criterion is respected

Scale up - Conclusion

From ZSE18 to ZSE35 scale

- ▶ Identification of the key targets
- ▶ Easiness in the screw profile translation
- ▶ Screening the functioning domain
- ▶ Optimizing the conditions

In a virtual way !!

Ludovic[®] - driving the process efficiency

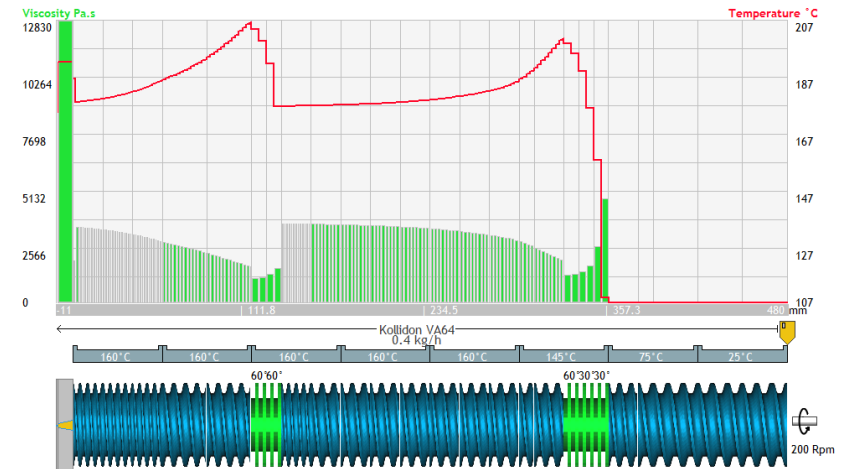

▶ Experiments constraints

- ▶ Experiments costs
- ▶ Measures difficulty
- ▶ Mechanics knowledge
- ▶ Time consuming

▶ Ludovic[®] answers

- ▶ Virtual trials
- ▶ Models for input
- ▶ Readable results
- ▶ Only a few minutes

Going further with Ludovic®

- ▶ **Twin Screw Course (TSC)**
 - ▶ On March 21-22, 2018
 - ▶ On the French Riviera (Sophia Antipolis)
 - ▶ 2 day course on Twin Screw mechanisms and simulation

Thanks for your attention

5

Ludovic[®] functioning

- ▶ The model
- ▶ The advantages

Control the process to control the Product

The model

- ▶ Flat geometry modeling
 - ▶ Screw partition in computation domains
 - ▶ C-Chamber areas
 - ▶ Robust model
 - ▶ Fast computation

Flattened geometry for a two-flight screw

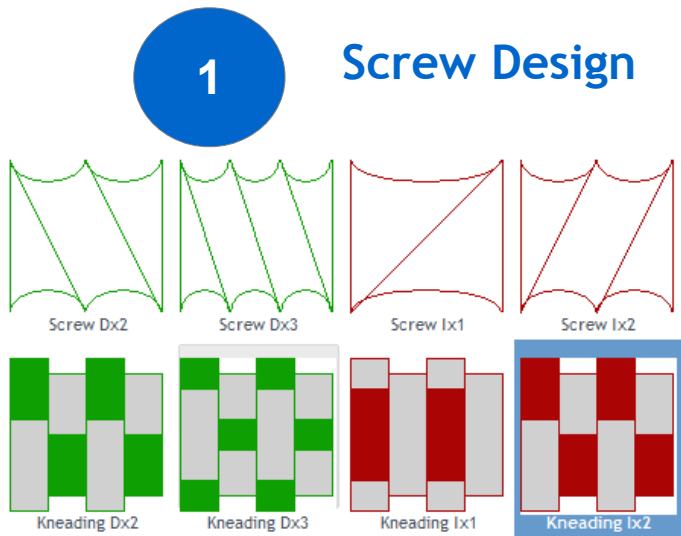

C-chamber scheme for a conveying element

Dedicated to corotating TSE

- ▶ Dedicated environment
 - ▶ Customizable screw elements
 - ▶ Products library
 - ▶ 3 Tabs technology for simulation definition

6

Ludovic[®] solutions

- ▶ Quick adaptation
- ▶ Fast ROI
- ▶ Including support

Control the process to control the Product

Ludovic[®] benefits

- ▶ **Speeding up the time to market !**
 - ▶ Saving 30% time
 - ▶ Saving 50% materials and trials
 - ▶ Controlling the process
 - ▶ Optimizing the product

6 trials

- 3 days (prep. + trials + cleaning)
- 2 persons
- 200 kg material

- Total human cost : ~4 200,00€
- Material cost : 400,00€

90 simulations

- 3 hours (prep. + trials + cleaning)
- 1 person
- 0 kg material

- Total human cost : 300,00€
- Material cost : 0,00€
